Asset management consultation in support of SAP® EAM

Asset management consultation is available to clients using the SAP® Plant Maintenance system, requiring interventions to improve specifically identified aspects of their system and EAM processes.

These interventions are facilitated by experienced consultants focused on understanding and optimising specific system configurations, functionalities and business processes.

Our Consulting Services

A team of highly qualified consultants with high levels of experience in SAP® Plant Maintenance systems and asset management and is responsible for delivering these services.

SAP® Plant Maintenance

- Development of Asset Care Plans
- Asset Criticality Analysis
- Work management best practice and implementation
- Asset Identification and Verification
- Reporting and KPI development
- Focused improvement projects
- AM accredited training
- Condition monitoring services

Do you know what you don't know?

Test your current data integrity and internal business process compliance. Knowing the maturity of your system performance is an essential prerequisite for understanding what system improvements need to be made. This lays a solid foundation for asset management.

We believe that the **success of consulting interventions** is dependent on:

The client understanding their needs or challenges and being prepared to address these.

The on-site team understanding and agreeing with the proposed solutions and participating in the planning, implementation and executing thereof.

The enabling of the team to ensure that the required work continues after the consultants have completed their part of the agreement.

Senior management's support of the provided solution.

A culture of continuous improvement and a team that is geared towards finding practical solutions, even if that means new ways of doing things. That its assets are safe to people and the environment.
